

SDLC — Tiny Case Study 6

The IT group by XYZ Corp has recently successfully built a human resources system using Agile methodology. The project utilized a lot of forms and interactions with the database. Agile was seen as an amazing methodology that kept the schedule deterministic, where everyone was assigned a task that was completed within the allotted time.

XYZ Corp has recently gotten a contract to build software for a self-driving car. They have decided to approach the problem in true Agile spirit.

Questions:

1. What are pros/cons of doing such a project using Agile?
2. What approach would you pick? Why?
3. How would you confirm that your approach is better?
